Carbonate Reservoirs Porosity Evolution Diagenesis In A ...

In carbonate reservoirs, reservoir porosity evolution is mainly the result of carbonate minerals dissolution and precipitation, such as dolomitization [11–14]. Fluid–rock reactions are usually the main factor for the porosity evolution because it results in carbonates dissolving to form voids, although

(PDF) Overview of Porosity Evolution in Carbonate Reservoirs

Calcium carbonate cementation and compaction are diagenetic processes that are initiated soon after deposition and by which intergranular pore space is progressively reduced producing systematic changes in petrophysical properties (see Evaluating diagenetically complex reservoirs and Reservoir quality).
