Over the years, hundreds of notations, often referred to as conceptual or semantic models, have been proposed for such modeling tasks. In general, a conceptual model comprises a collection of:

- Primitive terms, which specify a set of basic building blocks for constructing symbol structures;
- Structuring mechanisms for assembling and organizing symbol structures;
- Primitive operations, for constructing and querying symbol structures;
- General integrity rules, which define the set ...

A modeling perspective in information systems is a particular way to represent pre-selected aspects of a system. Any perspective has a different focus, conceptualization, dedication and visualization of what the model is representing. The traditional way to distinguish between modeling perspectives is structural, functional and behavioral/processual perspectives.

A conceptual model is a representation of a system, made of the composition of concepts which are used to help people know, understand, or simulate a subject the model represents. It is also a set of concepts. In contrast, physical models are physical objects; for example, a toy model which may be assembled, and may be made to work like the object it represents. Conceptual model may refer to models which are formed after a conceptualization or generalization process. Conceptual models are often

Conceptual modelling. In broad terms, conceptual modelling is the process of developing a graphical representation (or model) from the real world. In the context of collaborative problem-solving it provides an easily understood representation of the system for the different stakeholders involved. The process of conceptual modelling requires decisions to be taken regarding the scope and level of detail of the model.

Conceptual modeling of software systems uses only five UML diagram types: (1) class diagram, (2) state diagrams, (3) use case diagram, (4) sequence diagram, and (5) profile diagram. Fig. 2.6 contains all the UML diagram types used, the oriented vertices between diagram types denotes their construction order and the source of the diagram. In most cases the root diagram is the class diagram, but there can be scenarios where a domain specific language is created prior to constructing ...

## **Theory of Conceptual Change - UKDiss.com**

Conceptual modeling is about describing the semantics of software applications at a high level of abstraction. Specifically, conceptual modelers (1) describe structure models in terms of entities, relationships, and constraints; (2) describe behavior or functional models in terms of states, transitions among states, and actions performed in states and transitions; and (3) describe interactions and user interfaces in terms of messages sent and received and information exchanged.

The Conceptual Data Model should reflect relationships from a historical, longitudinal perspective. For example, a relationship between Store and Employee may usually be considered a one-to-many, but when viewed from a historical perspective perhaps the relationship may actually be many-to-many – what if the Employee begins work at another Store? In addition, Conceptual Data Models should reflect both as-is and to-be in the same model.

A Conceptual Data Model is an organized view of database concepts and their relationships. The purpose of creating a conceptual data model is to establish entities, their attributes, and relationships. In this data modeling level, there is hardly any detail available on the actual database structure.
